

Team Working Agreement, Definition of Done, and Style Guide

CircleHome

Team: Camille Yabu, Antonio Wydler, Pravin Agrawal-Chung, Cameron Cox, Jacqueline Lopez-Carbajal

Course: CSE 115A – Introduction to Software Engineering

Date: June 2026

Team Working Agreement

Communication

- Primary communication channel: Discord (general questions, daily check-ins)
- Time-sensitive issues escalated via iMessage group chat
- All team members expected to respond within 24 hours on weekdays

Meetings

- Sprint planning held at the start of each sprint
- Weekly standups to share progress, blockers, and plans
- Scrum Master rotates each sprint (Sprint 1: Pravin, Sprint 2: Antonio, Sprint 3: Cameron, Sprint 4: Jacqueline)

Work Distribution

- Tasks assigned during sprint planning based on user story ownership
- If a team member is blocked, they notify the group immediately so work can be redistributed

Conflict Resolution

- Disagreements on implementation are discussed as a group and resolved by majority
- If unresolved, the Scrum Master makes the final call for that sprint

Definition of Done

A user story is considered Done when all of the following are true:

- ☐ Feature is fully implemented and matches the acceptance criteria in the sprint plan
- ☐ Code is committed and merged to the main branch with no merge conflicts
- ☐ Feature runs without crashes on the iOS simulator
- ☐ Feature runs without crashes on the Android simulator
- ☐ All affected screens display correctly on both phone and tablet layouts
- ☐ Loading states and empty states are handled (no blank screens or unhandled nulls)
- ☐ Any new Firestore reads/writes follow the existing security rules
- ☐ At least one other team member has reviewed the code before merge

- [] The relevant user story is updated in the sprint plan as complete

Style Guide

Language & Framework: Dart / Flutter

File Naming

- All Dart files use snake_case (e.g. task_feed_screen.dart, firestore_service.dart)
- Screen files are suffixed with _screen.dart
- Service files are suffixed with _service.dart
- Utility files live in lib/Utils/

Code Formatting

- All code formatted with dart format before committing
- Max line length: 100 characters
- Use const constructors wherever possible to optimize widget rebuilds

Naming Conventions

- Classes: UpperCamelCase (e.g. TaskFeedScreen, FirestoreService)
- Private members prefixed with _ (e.g. _selectedCategory, _save())
- Constants: lowerCamelCase or SCREAMING_SNAKE_CASE for truly global constants

Widgets

- Each screen is its own file under lib/screens/
- Shared logic lives in lib/providers/ (state) or lib/services/ (Firebase calls)
- Avoid deeply nested widget trees — extract sub-widgets into private classes within the same file (e.g. _RankRow, _Podium)

State Management

- App-wide state managed via Provider (AppState)
- Screen-local state uses StatefulWidget

Firebase

- All Firestore reads and writes go through FirestoreService — screens do not call Firestore directly
- Use StreamBuilder for real-time data, one-time reads use await
